Comp 170 Object Oriented Programming

A FIRST SERIOUS PROGRAMMING CLASS

DR. WILLIAM L HONIG
What will we do?

Learn Programming
Variables / Types: store information; create knowledge
Control Structures: what happens when; how to get job done
Object Oriented Programming: the most important kind of development (and why)

How?
Learn concepts: Have a tool box of approaches; pick and choose
Write code: Picky rules of syntax; know what to do when
Read code: Learn how others / experts do things
Work in teams: Share the learning

A lot of work! Really a lot of work!!

Many have trouble@#?

I can help you get it – do what I say!
Other Programming Courses.... maybe right for you? Let’s talk....

- **Comp 125** Core
- **Comp 150** Core
- **Comp 180** (for scientists)
- **Comp 170**
  - Starts the major
  - Some programming experience (any language)
  - Know variable, if statement, function / subroutine
  - ...or good (very good) in math, puzzles, logic
- **Comp 271**
  - Can program in Java, C++, C# well
  - ...incl create classes that interact
“Programming is a Contact Sport”
W L Honig August 2016

**contact sport**

**NOUN**
a sport in which the participants necessarily come into bodily contact with one another.

To learn to program:

Your eyes, hands, fingers, brain, and whole body need to be in regular and close contact with programming.
Anyone here suffer from Ergophobia?

ergophobia

NOUN
Ergophobia: An abnormal and persistent fear of work. Sufferers of ergophobia experience undue anxiety about the workplace environment even though they realize their fear is irrational. Their fear may actually be a combination of fears, such fear of failing at assigned tasks, fear of speaking before groups at work, or fear of socializing with co-workers. "Ergophobia" is derived from the Greek "ergon" (work) and "phobos" (fear).

Let’s work on this together!

Classroom is a good place to get over it
Applying Programming Principles ...

Using reading...

Thinking...

Doing...

Getting help...

Germane (effective) cognitive load
Class may not be what you expect...

Active learning, hand-on engagement, flipped classroom,

To begin this class you need:
1. Some exposure to programming
2. Good math knowledge (love of solving problems) e.g. Sudoku anyone?
3. Concerns? Not sure: let’s talk now!

To succeed in this class you must:
1. Prepare outside class
2. Participate fully in class work
   Attendance required
3. Use online resources outside of class
   Discussion board
   MPL lab exercises
   Programming
Introduction to Object Oriented Programming

• Thinking as a Programmer
  – Concepts
  – Design Choices
  – Think before Do

• Programming in Java
  – Syntax – very carefully
  – Major, Serious, Programming Language
  – Write small and medium sized programs
Two Level Thinking for Programmers

CONCEPTS

Variables
Boolean Logic
Statements and Expressions
Types and Declarations (and Type Checking)
Control Flow; Control Structures (Conditionals, Loops)
Functions / Methods / Procedures
Class and Object (separate and related)
Memory Allocation and Usage

DETAILS

All those funny symbols
◦ \{ \} ( ) [ ] , ;
◦ + - / * %
◦ || &&

All the gibberish
◦ void
◦ public, private
◦ If while do return break
What we will learn...

The Programmer’s Mind Set

- JAVA Programming
- Debugging
- Thinking as A Programmer
- Unified Modeling Language
- Design
- Object Oriented Programming
- Programming Concepts
A Lot of Things We Won’t Do (at first)

1. Use GUI such as Windows
2. Do OOP, except in passing
3. Write large programs

So programs may be a bit BORING, for a while
The Harkness Method
...old but new...

• Using discussion, Harkness table, all contribute, learn with others.

• Students make meaning of new information by talking, listening, and thinking together.

• Collaborative learning, student lead (teacher as guide)

Originated Phillips Exeter Academy, 1930, Edward Harkness

http://www.exeter.edu/exeter-difference/how-youll-learn
## Rules, Expectations, Fairness

See details in syllabus

<table>
<thead>
<tr>
<th>Required</th>
<th>Examples</th>
<th>How?</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Preparation and Participation</strong></td>
<td>1. Come to class ready to work, discuss, question, explore</td>
<td>Read Text + Forum Lab (3xclass time)</td>
</tr>
<tr>
<td></td>
<td>2. BRING KNOWLEDGE with you</td>
<td></td>
</tr>
<tr>
<td></td>
<td>3. Work outside class too</td>
<td></td>
</tr>
<tr>
<td></td>
<td>4. Attend all classes, full time</td>
<td></td>
</tr>
<tr>
<td><strong>Assignments and Communication</strong></td>
<td>1. Correct assignment, correct files, right format, finished work</td>
<td>Plan Ahead Use Schedule Checklist</td>
</tr>
<tr>
<td></td>
<td>2. On time, ahead of time</td>
<td></td>
</tr>
<tr>
<td></td>
<td>3. Late Pass only exception (2 only)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>4. Email is last choice for communication (last century tool, from ‘79 and before)</td>
<td>Accept consequences</td>
</tr>
<tr>
<td><strong>Responsibility &amp; Accountability</strong></td>
<td>Don’t even ask:</td>
<td>Don’t Ask</td>
</tr>
<tr>
<td>Avoid needing excuses</td>
<td>1. My internet was down, can I still turn in?</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>2. I forgot, sorry, can I make it up?</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>3. I was not in class, did I miss anything?</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>4. Can I make up something I did wrong?</td>
<td>No</td>
</tr>
</tbody>
</table>

Why? Programming is all about **Precision and Correctness**
Learning to Program Properly...

Programming is about Precision and Quality / Correctness

Hacker Mindset:
- Program, program, program
- Work on whatever I know how to do first
- Big, complex programs
- Continue until get ok outputs for some inputs, or until time runs out
- Always about 80% done

Computer Scientist Mentality:
- Plan, consider alternatives
- What language features and concepts may help
- Coding is the last and easiest part of the work
- Design (pseudo code) first, then program
- Code that is small, well structured, easy to read
- Code that is obviously complete and correct
  - BEAUTIFUL CODE!

You CAN learn the difference by the end of Comp 170
If you DON’T may never get it
Trust me, I am one of the best!
Assignment Submit Process

...how to have high quality result

1. Select the correct Sakai Assignment
2. Complete your work, check it twice
3. Save your work; create files with correct file types and file names; you can save multiple times, replace old files, etc.
   - Examples A4mylucidHolyDigits.zip, Quiz2mylucid.doc
   - Files types may be .doc, .docx, .pdf
   - Java code in .java files or .zip of a whole project
   - You can submit multiple files; only .zip if indicated in assignment
   - No .pages files; no spaces in file names; must have file extension
4. Start early, at least 15 minutes before due time
5. After you think you are done, close the assignment window, reopen it and download your files to check they are correct
6. Submit the assignment
7. Exit the assignment and come back in to be sure it shows submitted!
Etiquette

It Should Not Be Necessary To Say …

• No, you cannot listen to music during class
• No, you cannot use your phone during class (quiet mode please)
• No, you cannot get up and leave whenever you wish
• No, don’t chat with your neighbor (except during work time)
• No, don’t ask for extra credit at the end

January 13, 2015
Tools = A Programmer Lives and Breathes

Eclipse Integrated Development Environment (IDE)

IDE =
◦ Editor (enter and change text) with knowledge of language
◦ Compiler (check program for grammar and spelling rules)
◦ Execution Environment (run the program)

A real world tool, a bit complex...
Supports many languages and computers (e.g. Android development)

https://www.eclipse.org/home/index.php
An Open Source Project
Tools = A Programmer Lives and Breathes

Hands on, try out, guess answers, see solutions
Instant answers to program fragments
  ◦ See others solutions
  ◦ Easy to try, guess, experiment
  ◦ Easier than Eclipse (needs a full program)

Will use for some course labs (points)
One place for you to look while reading text or studying a concept
  ◦ Try, Try, Try
  ◦ Try again
  ◦ Keep trying...

http://www.turingscraft.com/

CodeLab a tool for learning programming
http://www.pearsonmylabandmastering.com/northamerica/myprogramminglab/

MyProgrammingLab is bundled with online text (Peason packaged text with CodeLab)
Tools = A Programmer Lives and Breathes

**Virtual Machine**

Your own cloud computer
- You are the administrator
- Can add things, install,...
- DO NOT remove things that are there (you need them for class)

A sign of the future
- Pervasive Computing
- Mobile devices
- Internet of Things
- ...
My Program Won’t Work !?#$?

Three distinct kinds of errors while programming:

1. **Syntax Error (Compile Error)** Error messages in Eclipse; May give exact information or may be misleading, confusing. Often only the first one counts
   
   Approach: Compile often (at least every method); fix the first one; look above the error message too!
   
   Have some templates (main, stub of a function with parameters and that returns values, etc)

2. **Runtime Error** (Bomb, Exception,...)
   
   Approach: What input caused the error? Does it always happen, or only on some inputs?
   Should the program check to prevent bad inputs?
   Add debugging statements to see how far the program ran before the error

3. **Logic Error** (Runs and does the wrong thing)
   
   Approach: Play computer and follow through the program. Where did it go wrong (parameters, logic, ....)

**KEY Ability to learn = What Kind of Error and How To Fix It!**
Why Java??

1. Most widely used programming language
2. In the main serious programming family (C, C++, C#, ...)
3. Java and the Web arose together
4. Java programs (largely) computer, machine, operating system independent

What we learn will apply to Java, C++, Javascript many other languages
Some Links to Java Documentation of Interest

1. Java 8 SE Reference for Developers
   https://docs.oracle.com/javase/8/docs/api/

2. Java Tutorials
   http://www.oracle.com/technetwork/topics/newtojava/overview/index.html

3. Java keywords (don’t use for your names)
   http://docs.oracle.com/javase/tutorial/java/nutsandbolts/_keywords.html

Good to be able to see the reference to augment the text!
Real Programmers Use This all the TIME!
Truth Tables = Basis for EVERYTHING

Why George Boole is famous

- True / False
- On / Off
- 1 / 0
- Hi / Lo

Any calculation can be done with And, Or, Not

Any calculation can be done with only NAND

Transistors are either On or Off

Computers use lots of transistors (to build logic gates)
Conjunctive Disjunctive Normal Form

ANY TRUTH TABLE CAN BE TURNED INTO A LOGIC FORMULA

CDNF - I CALL IT AND OR NORMAL FORM

Mechanical way to convert any truth table into a logic formula using AND, OR and NOT

Conjunction = AND    Disjunction = OR

How to do it: and together each row that has a one in the result. If the input is True, use it by itself, if the input is False, put a NOT in front. OR them all together. You look only at the rows of the truth table with a 1 in the result. Ignore those with 0 in the result

Example: (A and NOT B and C) or (NOT A and B and NOT C) or (NOT A and B and C)
How Many Truth Tables Are There with 2 Inputs?

Draw a truth table with two inputs A and B
Add every possible output you can think of.....
(a bit like program testing, thinking of all the possible values a variable or a return value can take)

How many can you write in C#?

Try it:
- Given variables a and b
- (What would their type be???)
- Make each one a function, give it a name
- (Return the result, what type???)
Why worry about programming style?

MOTIVATION

Programming languages are big, flexible
- Many options; alternative ways to express concepts
- NOT very prescriptive on appearance of program

Without direction, programmers deal with this complexity on their own
- Programmers develop own personal style
  - Often ad hoc and haphazard
  - Changes over time as programmer “learns”
  - Trial and error process
    - Opportunity to speed up this learning

Programming is seldom a One Person Task
- Sooner or later, other’s must read, use, review your code
  - Team programming, software reuse, grading....
    - A shared or common style eases the next person’s task

WHAT DOES IT DO?

Standard Rules for:
- identifiers
- indenting
- Naming different things to look differently
- Ways to write control structures

Goal: Familiar, easy to read, code that avoids common errors
Use Good Mnemonic Names (1 of 2)

Use names that imply their role in the program
- Use names that are reasonably long and descriptive
- Better than adding separate comments to the code!
- Identical in code size, run time, ...
- It takes time to devise and make use of informative names
  ➢ Aids readability (self and others)

\[
\begin{align*}
  x_1 &= x_2 \times x_3 + x_4 \times x_5; \\
  x_6 &= x_7 \times x_1; \\
  x &= x_1 - x_6;
\end{align*}
\]

\[
\begin{align*}
  \text{grossPay} &= (\text{wage} \times \text{hours}) + (\text{overtimeWage} \times \text{extraHours}); \\
  \text{tax} &= \text{taxRate} \times \text{grossPay}; \\
  \text{netPay} &= \text{grossPay} - \text{tax};
\end{align*}
\]
Use Good Mnemonic Names (2 of 2)

Use style that helps to identify What is What

- No real cost if done consistently and from the beginning of development
  - Prevents compile errors
  - Reduces need to “look things up”

```cpp
date my_birthday;
if (my_birthday.year() > too_old_year)
    cout << “Too old for this event”;
```

```cpp
Date myBirthday;
if (myBirthday.Year() > TOO_OLD_YEAR)
    cout << “Too old for this event”;
```
Why impose a style guide?

Three Reasons

1. Help programmer avoid common errors
   ◦ Common syntax or semantic errors
   ◦ Experience shows programmers often make this error

2. Make programs more readable or reusable
   ◦ All programmers to do things in similar ways
   ◦ Standard ways to find things in a program
   ◦ Helps original programmer and later “users”

3. Limit flexibility or options to a few well proven ones
   ◦ Select among many ways to do the same thing
   ◦ Experience in real world shows the best approach
Examples

Avoid errors and common problems

A1.6.1—The i£ Statement

Avoid the "if ... if ... else" trap. The code

```c
if ( ... )
  if ( ... ) ...;
else ...;
```

will not do what the indentation level suggests, and it can take hours to find such a bug. Always use an extra pair of { ... } when dealing with "if ... if ... else":

```c
if ( ... )
{
  if ( ... ) ...;
} // {...} are necessary
else ...;

if ( ... )
{
  if ( ... ) ...;
  else ...;
} // {...} not necessary, but they keep you out of trouble
```

Studies have shown that the most acceptable forms of for loops (to avoid off-by-one errors) are these:

```c
for ( i = 0; i <= max_index; i++ )

for ( i = 0; i < sizeof(array); i++ )

for ( i = max_index; i >= 0; i-- )
```

You need a really good reason to write anything different!
Top – Down Development

PROBLEM APPROACH: MAKE IT EASY TO SOLVE THE WHOLE THING AT ONCE!

System Thinking:

1. What is everything I need to do?
2. Divide into key chunks
   Just name the “hard” parts, e.g. “reverse the string”
3. Order the chunks (full program)
   Create the proper control flow for the whole app
4. Create stubs for the underlying parts
   They can do stupid things, e.g. always return 1
5. Order the chunks
   Create the proper control flow for the whole app

STEPWISE REFINEMENT

Main (façade pattern)

Get the whole program to run; keep it running!
Then refine stubs into more complete code
(any number of levels work)
Eventually solve the hard chunks when they are self contained
OOP Problem Solving

PROBLEM APPROACH: UNDERSTAND THE CLASSES AND RELATIONSHIPS FIRST

THINK before PROGRAMMING:

1. What classes do I need? Think about STATE

2. Find some key methods. Write signatures
   Not only get and set....

3. What’s hard / complex / interesting to do?
   How do objects need to interact?

4. Test driven development (Advanced)
   Details of a few test cases and expected results

5. Done? Can you see how it all works?
   Recycle through the above, again, and again, and...

6. Code
   Recycle through the above, again, and again, and...

UML IS A TOOL FOR UNDERSTANDING

See the footsteps for the whole thing you need to do!

No mysteries; no magic

Remember: state is key (how to set it up at start, how to maintain it correctly, when it changes)
Hash Functions – Quickly...

A KEY PART OF SO MANY PARTS OF COMPUTING

Hash function:

1. Linear Algebra – a many-to-one function, may be onto; usually Many >> One.

2. Map or translate a large number of possible inputs to a smaller number of possible answers. A function that “compresses”

3. “Collisions” occur when more than one input maps to the same result. (All solutions deal with this)

4. E.g. SHA1 maps strings of characters to a 160bit number.

EASY TO DO (BADLY); HARD TO DO WELL

Simple example is modulo arithmetic
The 170 Top Ten

Maybe not everything you need to know to ace 170, but key things you must know for success.

We will come back often to this list.

Keep your own checklist of how you are doing!

### Key Concept; Learning Outcomes; Critical Knowledge

<table>
<thead>
<tr>
<th></th>
<th>170</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Be able to distinguish variable / type and class / instance</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Know syntax rules and style with careful precision</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Use conditional control structures fully and correctly</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Construct loops with control structures</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>Use the primitive types and operators appropriately</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td>Understand and create functions and methods</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Learn how to create OO Classes</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>Understand the OO interface concept and usage</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td>Use arrays and Collections to organize information</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>Perform simple Input / Output processing</td>
<td></td>
</tr>
</tbody>
</table>

Deprecated, update coming soon. You can still use for a general idea of key things to know!
How can I help?

Comp 170 is a hard course, but there will be lots of help!

You don’t know how to do something until you can teach it!
